

Transcar transports record breaking heavies in Malaysia

When a client has something very special to shift, something that hasn't been done before, they take particular care before choosing whose hands to place it in.

In this case we speak of 4 LPG storage vessels (bullet tanks) each measuring 76.051m length x 8.5m diameter, weighing 690 Tonnes. These are the largest bullets ever manufactured in Malaysia, which has been duly recorded in The Malaysia Book of Records.

Following months of consultation with the Client, route studies and transport engineering evaluations, Transcar were awarded the job as a result of some very innovative transport and handling proposals for the pieces. Given that these units are worth millions of dollars, and the fact that Transcar had not previously undertaken such major movements for this particular Client, they must have been mightily impressed by what was proposed.
